

# Release Notes November-December 2015 3.145.3672.0

## Updates and Enhancements

- Multiple enhancements to Price Schedules including functionality to better handle Schedules with large numbers of trading partners.
- In the Load Freight Allocation function, when the allocated money is applied to the simple Freight Charge in the Order Product Lines, if there are two or more simple Freight charges, EnvioAg will now put the money in the first one according to the Charge Display Order (and only the first one). The Charge Display Order can be set from EnvioAg's Configuration menu using the "*Set Charge Display Order*" option. The change will affect Freight Allocation for Sales, Purchase Orders, and Transfer Orders

## Repairs

- Sales Order Product Lines no longer allow a Product Line to be changed to an Addon Line in a Credit Memo
- Repaired issue in the void action of Supplier Receipt Items, when a Supplier Receipt (Items have not been dumped or shipped) has voided all of its Items, and the Supplier Receipt is then deleted. If another supplier receipt required a voided item, EnvioAg no longer returns an error and continues as expected.
- In Run Dump, the default Dump Date Time feature was not working, this has been corrected
- An issue arose in PO Receipt when attempting to allocate net weight, the allocate window was showing tags from other PO Receipts. This version automatically corrects those "freeloading" tags.
